About the American Community Survey

The American Community Survey (ACS) is an annual survey conducted by the US Census Bureau. The ACS asks a host of demographic, economic, and housing related questions that were historically associated with the now discontinued long-form of the Census.

The ACS is a sample of the total population. As a result, the data are subject to sampling error. All counts displayed in the ACS are **estimates** with a plus/minus factor for all counts and percentages. Additionally, because of the small sample sizes of the ACS, it is not possible to estimate characteristics for small geographies with the one-year data collections. In order to look at small areas within a city, such as neighborhoods, data users need to use the 5-year ACS estimates. The first 5-year estimates (2005-2009) for the ACS are now available and are the basis of this report. It is important to note that the 2005-2009 ACS data are not Census counts, but rather estimates of population characteristics. As a result, counts estimated in this report will not match those corresponding population counts observed in the 2010 Census.

Please note that subcategory percentages in this report reflect the percentage within the category it is associated with and not the percent within the total. Major categories are typically highlighted in blue in this report. Subcategories are distinguished by indented text.

Also, as there are only group quarters on the Harbor Islands, variables involving households and families have been omitted from this report.
